Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
Epitopic peptides may be used with synthetic hapten derived from a pathogen to generate an immune response to the pathogen. Peptides are recognised by numerous T-helper call clones within the context of a wide range of alleles of the human MHC. The peptides may be used in an antimalarial vaccine inducing Ab.

Non-dendritic peptide carrier linked to a solid phase - usefu diagnostic agent and as a scaffold for production of chemical derivatives

Example 20; Page 124; 262pp; English:

A non-dendritic peptide carrier (A) has been developed which is coupled through a linker to a solid phase, forming a complex of (A) solid phase.

Where (A) comprises 10-50; amino acids capable of forming a secondary structure in a benign buffer after liberation from the solid phase, and further the (A) solid phase complex comprises an immunogenic substance represents a peptide used in an example from the present sequence (A) solid phase complex can be used as a scaffold for the production of the present invention. An constant of the present invention and inmunostimulating Complex (Iscom) resulting an an immunostimulating Complex (Iscom) resulting an for the promotion of cell-attachment to solution by conjugation. (A) derivatised with mg fibronectin-, laminin- or vitronectin-like for the chemical coupling of antigenic Also a derivatised (A) can be used is used

encoding heavy chain sequences from the humanised anti-Pc gamma RI monoclonal antibody H22. The resulting fusion protein was shown to be significantly more efficient in antigen presentation and T cell stimulation that the TH30 epitope alone. A similar fusion construct was prepared coding for a mutant, antagonistic form of the epitope (designated TT8313S) fused to the anti-Pc gamma RI. The Fab22-TT831S is at least 100 times more effective than TT833S in inhibiting T cell activation. Synthetic DNA coding for the wild-type universal Th epitope from tetanus toxoid, designated TT830, was fused to the 3'-end of DNA 100.0%; Score 74; DB 18; Length 15; 100.0%; Pred. No. 3.9e-07; ive 0; Mismatches 0; Indels Local Similarity nes 15; Conserv 15 AA; Sequence Query Match

Recombinant, multi-specific anti-Fc receptor antibody molecules also comprise an anti-target portion, used for the treatment of cancer, autoimmune disease and pathogenic infection

```

The invention relates to a new carbohydrate peptide conjugate, which comprises a carrier with a dendrimeric poly-lysine enabling multiple comprises a carrier with a dendrimeric poly-lysine enabling multiple epitopes to be covalently attached to it. Also claimed are: (1) an entibody purified from biological fluid or cells of organisms antibody multiple carbohydrate peptide conjugate, and (2) a diagnosis of the carbohydrate peptide conjugate, and (2) a diagnosis kit are used to provide pharmaceutical compositions and capanisms kit are used to provide pharmaceutical compositions and capanisms kit are used to provide pharmaceutical compositions and capanisms viral infections caused by hepatitis virus, HIV or cytomegalo against viral infections caused by hepatitis virus, HIV or cytomegalo virus. They can be used to enhance immune responses, of humans and animals against bacterial infections. The call responses, of humans and animals against bacterial infections. The carbohydrate peptide conjugate stimulates the antibody and T-cell capanism without stimulating undesired immune responses. The composition is capanish the increasing the survival of tumour bearing humans and mineral capanisms. animals. The present sequence corresponds to residues 830-844 of tetanus toxin. The synthetic peptide corresponding to this sequence may be used as an epitope in a carbohydrate peptide conjugate.

```
AW71321-22 represent universal helper T-cell epitopes derived from tetanus toxin. They are used to enhance host immune response to vaccines. The specification describes a Plasmodium yoelil liver stage protein designated PyHSP1. This 17 kDa hepatic and erythrocytic stage protein designated PyHSP1. This protein elicits a response (From an Ig1 monoclonal antibody designated Navy Yoelii Liver Stage) (NYLS3). This antibody does not recognise sporozoites, but does recognise P. yoelii liver stage parasites. NYLS3 eliminates upto 90% of liver stage parasites. The specification describes a vaccine for reducing the severity or incidence of infection by a malaria parasite of the genus Plasmodium. The DNA vaccine comprises exon 1 and part of exon 2 of the PyHEP17 gene.
                                                                                                                                                                                                                                                                                                                                                                                                               vaccine for protecting mammal against infection by malaria caused by Plasmodium species - comprises a first nucleic acid encoding a first polypeptide capable of eliciting an immune reaction against an antigen expressed during the liver
                                                  Liver stage, Plasmodium; Navy Yoelii Liver Stage 3 antibody; NYLS3; hepatic and erythrocytic stage protein; PyHEP17; vaccine; malaria parasite; teanus toxin; P2; helper T-cell epitope.
                  Universal helper T-cell epitope P2 derived from tetanus toxin.

          This peptide corresps. to residues 947-967 of Tetanus toxin. It can be used as a universal carrier for the prepn. of an immunogenic conjugate. It is covalently bound to a peptide or polysaccharide
                                                                                                                                                                                                                    Db
           hapten derived from a pathogen. This conjugate can be used as a vaccine for malaria. This peptide is recognised by different Thelper cell clones in association with alleles of the human MHC.
                                                                                                                                                                                                                    RESULT 3

SECRETED (SHORT FORM).

-1-ALTERNATIVE PRODUCTS: TWO FORMS, A LONG TRANSMEBRANE FORM AND A SHORT SECRETED FORM, EXIST DUE TO ALTERNATIVE SPLICING.
-1-TISSUE SPECIFICITY: EPITHELIAL TISSUES AND BRAIN.
-1-DOMAIN: THE CYTOPLASMIC PART OF THE RECEPTOR MAY INTERACT WITH THE SH12 OR SH13 DOMAINS OF MANY SIGNAL-TRANSDUCING PROTEINS.
-1-FTM: LIGAND-BINDING INTERASES PHOSPHORYLATION ON TYROSINE RESIDUES AND PROMOTES ITS ASSOCIATION WITH THE PBS SUBUNIT OF PROMOTES ITS ASSOCIATION WITH THE PBS SUBUNIT OF PROPERTY.
-1-DISEASE: OVEREXPRESSED IN A SUBSET OF HUMAN MAMMARY TUMORS.
-1-SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.

TISSUE SPECIFICITY: UBIQUITOUSLY EXPRESSED IN EMBRYOS. IN LARVAE,
UNIFORM EXPRESSION IS SEEN IN WING DISKS, GENITAL DISK, ANLAGEN OF
TESTIS AND OVARY, AND BRAIN CORTEX. IN EYE-ANTENNA DISK, HIGHEST EXPRESSION IS ANTERIOR TO MORPHOGENETIC FURROW, LEVELS REMAIN HIGH IN PHOTORECEPTOR PRECURSOR CELLS. THIS PATTERN IS REVERSED IN POSTER/OR EYE DISK. IN ADULTS EXPRESSION IS HIGH IN BRAIN CORTEX AND THORACIC AND ABDOMINAL GANGLIA.
SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                     SEQUENCE OF 1133-1137; 1155-1167 AND 1209-1216 FROM N.A., AND MUTATION

                                  SUBCELLULAR LOCATION: Type I membrane protein.
MISCELLANBOUS: Binding of EGF to the receptor leads to
dimerization, internalization of the EGF-receptor complex,
induction of the tyrosine kinase activity, stimulation of
synthesis, and cell proliferation.
SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 1555; DB 1; Length 703; Pred. Immunogenic analogues Her2 can be used in the claimed method as an autovaccine to induce a response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. Regions suitable for the insertion of foreign helper egitopes were identified (see features table). The method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer

is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 B-cell group derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA; and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and human/murine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least ne foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Her2, respectively.

The invention relates to synthetic therapeutic compounds (antigenic peptides) with enhanced binding to major histocompatibility complex (WHC) molecules and enhanced immunoregulatory properties relative to their natural counterparts. Compounds of the invention are useful contentants of anti-cancer vaccines immunotherapy. They are useful as components of anti-cancer vaccines immunotherapy. They are useful as components of anti-cancer vaccines and to expand immune effector cells that are specific for cancers characterised by expression of the breast cancer antigen, HER-2. Polymucleotides that encode peptides of the invention are useful as transcripts that are expressed in antigen presenting cells (APCs), to confirm transduction of polymucleotides into host cells. The present sequence is human tyrosine kinase-type receptor, HER-2. Compounds of the invention are designed based on the HER-2 antigenic peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        180

                                                                                                                           The present invention provides a method of treating cancer by administering a conjugate of anti-ErbB antibody with a maytansinoid. particular, the antibody is directed against ErbB2 (also known as HER and p185neu). The method is particularly useful in the treatment of breast, ovarian, stomach, endometrial, salivary gland, lung, kidney, colon, colorectal, thyroid, pancreatic, prostate and bladder cancers
